## **1.0 Introduction**

### **PM<sub>10</sub> Standards**

In July 1987, EPA promulgated National Ambient Air Quality Standards for Particulates with an aerodynamic diameter of 10 microns or less (PM<sub>10</sub>). This is a size that can be inhaled into the alveolar regions of the lungs. The standard has two forms, a 24-hour standard of 150 ug/m<sup>3</sup> and an annual arithmetic mean standard of 50 ug/m<sup>3</sup>. The 24-hour standard is attained when the expected number of exceedances for each calendar year, averaged over three years, is less than or equal to one. The estimated number of exceedances is computed quarterly using available data and adjusting for missing sample days. The annual arithmetic mean standard is attained when the annual mean, averaged over three years is less than or equal to the level of the standard. Each annual mean is computed from the average of each quarter in the year, with adjustments made for missing sample days. In both cases, a data recovery of 75 percent is needed for each calendar quarter to be considered a valid quarter of data. This standard was modified in by EPA in July 1997, but was subsequently nullified back to this form in May 1999.

EPA's Natural Events Policy enables states to demonstrate that PM<sub>10</sub> exceedances were caused by natural events (volcanic and seismic activities, wildland fires, or high winds) and therefore are not to be taken into account in determining compliance with National Ambient Air Quality Standards (NAAQS). The Natural Events Policy requires that sufficient documentation be submitted to EPA to demonstrate:

1. That an event occurred that meets the definition of a natural event. This can include monitored particulate data, videos and photographs of the event, eyewitness accounts, and news accounts.
2. That there is a cause and effect relationship between the event and the exceedance. This can include meteorological data, receptor analyses, dispersion modeling, etc.
3. Should a PM<sub>10</sub> NAAQS violation occur due to a natural event, a Natural Events Action Plan (NEAP) should be implemented. Due to past PM<sub>10</sub> exceedances
4. NEAP's are in place for Lamar and Alamosa.

In this report, the Air Pollution Control Division (APCD) provides documentation to support that PM<sub>10</sub> exceedances monitored on October 30, 2003 at Delta, Crested Butte, Mount Crested Butte and Grand Junction were caused by a natural event.

## 2.0 Ambient Particulate Data

On Thursday October 30, 2003, Delta, Crested Butte, Mount Crested Butte, and Grand Junction recorded exceedances of the twenty-four-hour PM<sub>10</sub> standard with readings of 215 ug/m<sup>3</sup> at Delta, 177 ug/m<sup>3</sup> at Crested Butte, 165 ug/m<sup>3</sup> at Mount Crested Butte, and 234 ug/m<sup>3</sup> at Grand Junction. The exceedances were caused by a combination of dense smoke transported from the massive wildfires in Southern California and blowing dust from the desert Southwest and local sources. A local wildfire near Aspen also contributed to elevated particulate levels in the area.

Table 1 provides a summary of all the PM<sub>10</sub> and PM<sub>2.5</sub> data for the Western area of Colorado for October 30 and indicates those data that were affected by the natural event. These data have been flagged in AQS. The speciation PM<sub>2.5</sub> data value has not been flagged in AQS as it is “owned” by RTI. APCD is requesting that EPA flag this data value. The table also provides PM<sub>10</sub> data for the days before and after the natural event as a comparison.

Figure 1 shows the 700 millibars (mb) or 10,000-foot level features including a strong upper level low centered near northern Nevada. This low-pressure system caused strong southwesterly flow at 10,000 feet from southern California and Arizona all the way to western Colorado. The surface weather maps for 12Z (5:00 AM MST) October 30 and 00Z on October 31 (5:00 PM MST on October 30) are presented in Figures 2 and 3, respectively. These maps show a fairly deep surface low-pressure system moving from southern Nevada into western Colorado during the day of October 30. Southeasterly to southwesterly flow capable of transporting smoke and blowing dust from Arizona, Nevada, and Utah into Colorado persisted much of the day. Magenta infinity signs over station reports in these two maps show that haze, smoke, or blowing dust was observed in northern Arizona, Utah, and western Colorado. A cold Canadian air mass east of the Continental Divide protected eastern Colorado from the smoke and dust transported by this storm system.

Figures 4 and 5 show back trajectories for western Colorado for air masses at 500, 1500, and 2000 meters above ground level for midnight MST at the beginning of October 30 (0700 UTC) and 1600 MST (2300 UTC) on October 30. The back trajectories originate at 36 hours prior to the times in question. These clearly show that the flow at each level could have transported smoke from California and Arizona, affecting the first part of October 30, and blowing dust from local sources and perhaps Arizona, affecting the latter part of October 30. Surface reports and other data for October 30 suggest that dense smoke characterized the first part of the event followed by a brief reduction in haze, and finally followed by blowing dust during the afternoon and early evening hours.

Figure 6 shows the hourly PM<sub>10</sub> concentrations at Grand Junction and Aspen on October 30. Elevated PM<sub>10</sub> during the early morning hours gradually declined by late morning to noon. A second more intense surge of particulates is apparent in the late afternoon at Grand Junction. The late-day peak at Aspen lags behind Grand Junction by 3 to 4 hours, and this is consistent with the hypothesis that a plume of regional, blowing dust hit Grand Junction first and Aspen later. Clark County Department of Air Quality Management in Las Vegas, Nevada, was contacted during the afternoon of October 30. They indicated that blowing dust was causing

high levels of fine particulates during the afternoon and that most of the smoke had dissipated. Surface observations in Colorado, which will be discussed later in this report, also show that reports of haze or smoke were replaced by reports of haze or blowing dust later in the day. Available satellite imagery also supports the two-phase model of the event.

Table 1 - Particulate Data for October 30, 2003.

### **3.0 Meteorological Data**

On October 29, there was a reversal of the winds that had been blowing smoke from California out into the Pacific. Figure 7 shows a satellite image of the Southwestern U.S. on October 29. A massive, dense cloud of smoke can be seen in California and Arizona, carried by winds that had become westerly and southwesterly. Surface reports show that this smoke moved into much of the Four Corners area and western Colorado. Figure 8 shows a blowup of a portion of a satellite image for 11:10 MST on October 30. Residual smoke can be seen in this image over many of the basins and peaks of Colorado. Figure 9 is a blowup of a different section of a false-color version of the same image. In this case, the image reveals what is likely blowing dust in the desert basins between the Mogollon Rim in Arizona and Cortez, Colorado. The blowing dust manifests as a light, milky, pinkish opaque layer obscuring vegetative green on mesas and along river valleys in these areas.

The intense surface and upper level low-pressure systems over the Intermountain West generated widespread strong winds and blowing dust in Utah, Nevada, Arizona, and Colorado. Winds of 30 to 45 mph were common across the entire multi-state region. Sustained winds of 30 mph or higher and gusts of 45 mph or higher have been identified as a precondition for significant blowing dust in eastern Colorado when soils are dry (see reference for the *Natural Events Action Plan for High Wind Events – Lamar, Colorado*). These rough, wind-speed thresholds are probably applicable throughout the western U.S.

The weather data for October 30, 2003, at Grand Junction is presented in Table 2 below. The first 10 hours of the day saw visibilities of 3 to 7 miles in “haze” and light-to-moderate winds. This was likely the period most affected by smoke originally from the fires in California. The afternoon and early evening hours were characterized by visibilities of 4 to 5 miles in blowing dust and haze. One gust of 40 mph is reported at this station at 12:50 MST.

Table 3 and 4 list weather observations for Las Vegas on October 29 and 30, respectively. Light-to-moderate winds and visibilities of 1.75 to 6 miles were observed for most of the day on October 29. Smoke from California was the dominant source of poor visibility on October 29. Table 5 shows that visibilities were reduced to 3 to 6 miles in haze, smoke, and dust during the morning hours of October 30. Wind gusts of 44 and 45 mph were recorded on October 30.

Weather observations on October 30, 2003, for St. George, Utah, are listed in Table 5. Wind gusts of 40 to 48 mph were measured during much of the day. Visibilities dropped as low as 7 miles.

Haze or smoke was reported throughout much of western Colorado on October 20, 2003. These observations are reproduced in Attachment A. Winds were light-to-moderate during the morning hours in much of the western portion of the state. By late morning, gusts of 41 to 47 mph were measured at Kremmling, Monarch Pass, and Wolf Creek Pass. By 1:00 MST, gusts of 40 to 55 mph were observed at a number of valley and mountain pass locations. At 2:00 MST, Alamosa reported a gust of 45 mph and visibility of only three quarters of a mile. At 3:00 MST, Alamosa reported haze and a gust of 44 mph. Alamosa’s highest 24-hour PM<sub>10</sub> concentration on October 30 was 99 ug/m<sup>3</sup>. Presumably, this was the result of both dust and smoke. Gusty winds

continued through the early evening hours on the Western Slope. Telluride, Durango, Gunnison, and Pagosa Springs also recorded 24-hour PM<sub>10</sub> concentrations in the neighborhood of 100 ug/m<sup>3</sup>.

The following Grand Junction National Weather Service link provides a description of the smoke event of October 30 in western Colorado:

<http://www.crh.noaa.gov/gjt/oct03smoke.htm>. This article reports “Smoke began to filter into the Great Basin on Wednesday, and by Thursday morning (October 30), it had moved into eastern Utah and western Colorado. Residents woke to a murky sky and a red, ominous sunrise.”

The Grand Junction National Weather Service Office summary for October 30, reported on October 31, indicated the following:

WEATHER CONDITIONS

THE FOLLOWING WEATHER WAS RECORDED YESTERDAY.

LIGHT RAIN

HAZE

SANDSTORM

Figure 10 shows that the U.S. Drought Monitor had declared that a *severe, extreme, or exceptional* drought was underway in most of the Southwest including western Colorado. This designation was made on October 30 and was representative of conditions in place on October 28. The October 2003 percent of normal precipitation map in Figure 11 indicates that most of the Southwest had received significantly less than 40% of the normal precipitation for October, a month that does not normally see a great deal of precipitation in this region.

There is sufficient evidence of dry soils, high winds, blowing dust, and transport of smoke from California to explain the PM<sub>10</sub> exceedances recorded in Colorado on October 30, 2003. Other anecdotal evidence for this event is presented in additional documentation of the exceedances.

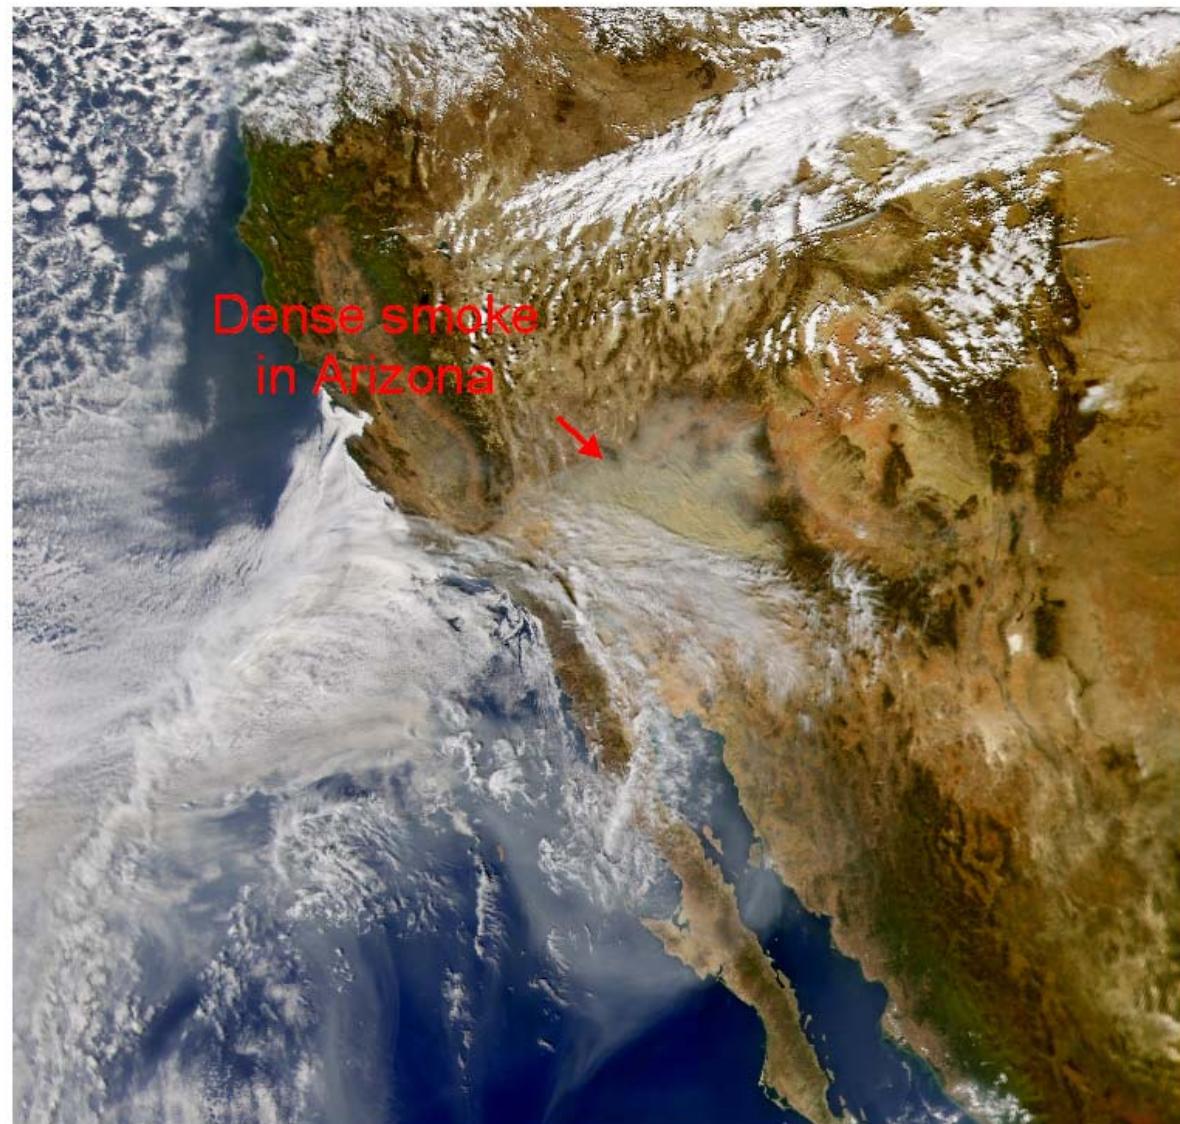

Figure 7 - Dense smoke from California wildfires is visible in the Southwest from a SeaWiFS Project Image by NASA/GSFC – ORBIMAGE – October 29, 2003. .

Figure 8 - Portion of a Terra/MODIS image taken at 11:10 MST on October 30, 2003 (see: <http://rapidfire.sci.gsfc.nasa.gov/production/2003303/>), showing residual smoke over basins and ranges in Colorado and upslope cloud cover to the east of the Front Range.

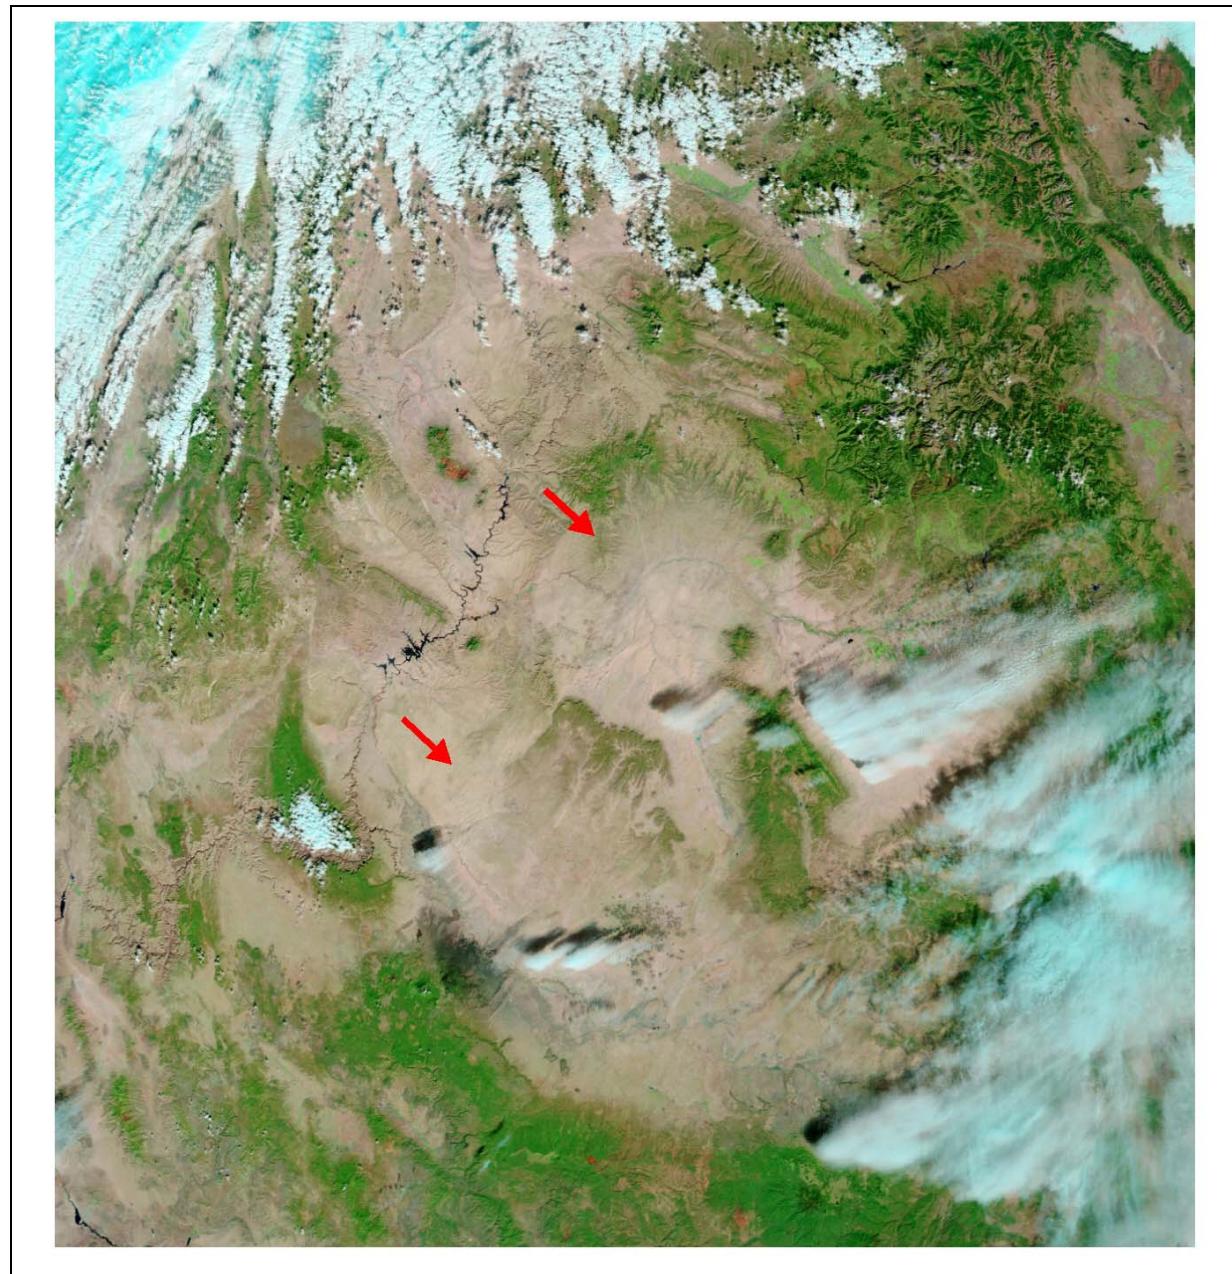

Figure 9 - Portion of a Terra/MODIS false color image for 11:10 MST on October 30, 2003 (see: <http://rapidfire.sci.gsfc.nasa.gov/production/2003303/>), showing milky, pinkish, blowing dust over desert basins from the green Mogollon Rim in Arizona to the Cortez, Colorado, area. The dust obscures vegetative green and the articulation of rivers and land forms normally clearly visible from space.

## 10.31.03 Smoky haze from Calif. is harmful, official says

By ERIN MCINTYRE *The Daily Sentinel*

The smoky skies in the Grand Valley, caused by the California wildfires, are unhealthy, a Health Department official said.

"We're up into the unhealthy stages of particulates," said Perry Buda, Mesa County Health Department air quality specialist.

A haze becomes visible when there are 50 micrograms of particulates per cubic meter of air, Buda said. The concentration of smoke-generated particulates measured three to four times that amount Thursday.

"When you drop down to five miles visibility ... you're looking at impacted air quality," Buda said.

The amount of smoke in the air may irritate people suffering from allergies or asthma, said Dr. William Scott, who specializes in treating those afflictions.

"There are some people who will be affected more by it — if you're asthmatic, you might want to stay inside," Scott said. People who are more sensitive to smoke may experience burning eyes or a cough, he said.

Buda advised people to stay inside if they're concerned about the smoke and said a good idea would be to limit outdoor exercise and close windows — especially for the young and elderly and for those with respiratory problems.

"If you have to be outdoors for a period of time, you might want to wear a filter mask," Buda said. The American Lung Association suggested using a damp cloth to cover noses and mouths if people have to go outside.

"I don't think people should panic ... but maybe it's not the best day for a three-mile bike ride," Scott said.

The smoke arrived in the Grand Valley late Wednesday on a slow-moving trough of northeasterly wind that was helping to the quell fires in southern California.

The brown smudge carried on erratic winds concealed the rim of the valley, leaving only a blurry outline of the Bookcliffs' shadow.

"This is directly related to the fires in southern California," said John Kyle, program director at the National Weather Service office in Grand Junction.

[Write to the editor](#)  
[Set my homepage](#)

Nearly 650,000 acres had burned or continued to blaze in southern California on Thursday, according to the National Interagency Fire Center.

Air quality professionals and forecasters said the smoke will probably be around through the weekend and longer if the fires aren't contained by next week.

A chance of rain in Grand Junction may help clear up the air a bit later this week, but light precipitation in California may not bring much relief for the fires overall, said Brian Avery, National Weather Service hydrologist.

"It might help a little, but it doesn't look like they're going to be too strong," he said.

**Smoke from Southern Calif.  
Now in Grand Valle**

Residents in Western Colorado wake up to a blanket of haze Thursday morning. The National Weather Service says it's the result of wildfires burning in Southern California. A strong area of low pressure developing over the northwest United States is bringing a west/southwest flow of air to the Grand Valley. Officials with the National Weather Service say that a cold front over the last 24 hours is enabling the smoke to settle here. Winds gusting up to 41 miles per hour prompted officials to issue a red flag warning for the Western Slope. We could continue to see smoke for the next several days. Health officials are urging people with breathing problems to take extra precautions until the smoke clears.

## Wildfire strikes Old Snowmass

By Adam Preskill and Thomas Watkins

**OLD SNOWMASS** - A handful of homes along Snowmass Creek Road in Old Snowmass had to be evacuated Thursday as a wildfire believed to have originated on Walt Disney Co. CEO Michael Eisner's ranch swept west up a ridge into federal lands.

The fire was only 5 percent contained by sundown, having consumed about 25 acres of wooded hillside despite the efforts of 55 firefighters called in from Snowmass Village, Aspen, Basalt and other fire districts. Only one small outbuilding has been damaged in the fire so far, and a small crew stayed on the scene overnight with three trucks to protect nearby structures.

Although the cause of the fire is still unconfirmed, officials believe it began sometime before noon when a tree knocked over some power lines near Eisner's mansion, located about 9.5 miles up Snowmass Creek Road near Snowmass Ski Area's Campground lift.

"One of the Snowmass firemen said he saw a tree that had fallen on an electric wire. That could easily be the source of ignition, but we haven't confirmed anything," Pitkin County Sheriff Bob Braudis said from the incident command center, with thick plumes of yellow smoke billowing behind him.

Snowmass Creek resident Tom Carroll, who evacuated his cabin but remained behind to share his knowledge of the terrain with fire personnel, was scouting the woods near his property Thursday morning in anticipation of a weekend elk hunt when he spotted the flames.

"We thought it was just smoke from the Boulder fire until it got really thick and we realized it was its own fire," Carroll said.

After igniting in a grove of trees on the flats east of Snowmass Creek Road, the blaze spread northwest across the road and up a wooded ridgeline, driven by heavy winds. Wind will likely continue to be a major problem for fire crews for the next few days, with gusts up to 70 miles per hour expected overnight and more blustery weather forecast for today.

In fact, all across the western United States, the weather conditions are ripe for wildfire. The National Weather Service has issued a 48-hour "red-flag warning" for Colorado and southern Utah, calling for increased fire precautions because of the high winds, low humidity and overly dry vegetation.

Pitkin County has adopted the weather service's red-flag warning, as have several other local jurisdictions. Front Range communities are struggling with wildfires as well, including a 3,500-acre blaze outside Boulder also thought to have been started by fallen power lines.

Although the sheriff's department did not enforce mandatory evacuations in Old Snowmass, all residents within a one-mile radius were advised to leave their homes. The county's Emergency Preparedness System - an automated "reverse-911" advisory tool implemented by the sheriff's department just last month - was used to warn residents of the situation.

No information was available on how many residences were contacted by the automated system, nor were officials able to determine how many people actually heeded that evacuation order. Estimates varied from six to 20.

Although the fire showed no signs of slowing as night fell, officials did allow those residents who had chosen to evacuate to return to their homes. But Nancy Schultz, a caretaker at Eisner's ranch, said that while her husband intended to stay behind to assist firefighters camping out on the property, she would be spending the night elsewhere.

"It's too close - it's right outside my bedroom window," Schultz said.

At day's end, the fire appeared to be heading down the Snowmass Creek valley away from the Eisner residence and a few other neighboring homes, Schultz said. But Carroll said as he watched the flames lick at the sides of Eagle Mountain that he feared the fire would reach the high alpine meadows in the federal lands that stretch all the way to Mt. Sopris.

"Once you turn this corner, it's all prairie grass and meadow where the elk are hanging out," Carroll said. "It's really, really dry up there. There's so much dead wood and brush, the elk are even having trouble making their trails."

While it appeared that few people were forced to evacuate the area, the number of livestock that had to be moved was substantial, Sheriff Braudis noted.

"We have coordinated a volunteer effort to move animals via private trailers and pasture them in places that are safe from the fire," he said.

Landowner Connie Harvey said she spent much of the day moving horses and cattle from the ranch she owns along Snowmass Creek to another family property along Maroon Creek.

"They were concerned about the wind, so we've been up there getting our horses in their trailers. ... Luckily I have a place I can put them," Harvey said.

Harvey has also given permission for crews to use water from the ponds on her property to aid firefighting efforts.

"They're hoping that tomorrow it will be possible to fly with helicopters or planes and dip water out of those ponds and dump it on the fire," she said.

Although a helicopter was assigned to fight the fire, high winds prevented its deployment, county officials said. Officials were hopeful conditions will permit the use of air support today, and they said a federal firefighting crew may also be available to assist at first light.

While the Snowmass Creek fire may have been the most pressing public safety issue of the day, it wasn't the only wildfire incident in the Roaring Fork Valley on Thursday.

At 1 a.m. the Carbondale fire department responded to a brush fire between two housing subdivisions in the West Bank area, squashing the 3/4-acre blaze just before it spread into a heavily wooded hillside - a turn that could have led to disaster, according to Deputy Fire Chief Rob Goodwin.

"We were able to get in there and knock it down pretty quickly, and then it took us a couple of hours to get it put out," Goodwin said. "It was in some sage brush, and had it gone into that piñon and juniper, it would have definitely made a run up to those homes. So it was an excellent stop."

No structures were damaged in the Carbondale fire, nor was anyone injured. The cause of that fire is still under investigation.

## Smoke from California chokes Aspen valley

By Troy Hooper/Aspen Daily News Staff Writer

It was an eerie awakening Thursday for Roaring Fork Valley residents who found a thick veil of smoke covering the morning sky.

Although fires were burning along Colorado's Front Range and later in Old Snowmass, the hazy conditions here resulted from firestorms raging in Southern California, according to a report from the National Weather Service office in Grand Junction.

The report - entitled "What's up with the smoke?" - explained that on Wednesday "a ridge of warm high pressure that dominated much of the (West) began to give way to a large, cooler trough of low pressure dropping south from Canada. ... With this trough came a strong jet stream (and) as the trough moved farther into the southwestern part of the country, strong winds aloft and an increased westerly flow began to drive the California wildfire smoke (to the east).

"Smoke began to filter into the Great Basin (in Nevada) on Wednesday, and by Thursday morning, it had moved into eastern Utah and western Colorado. Residents woke to a murky sky and a red, ominous sunrise," the report stated.

While the dark haze hid much of the valley's usual crisp fall colors, it also interfered with residents' routines.

"I could taste the smoke in my mouth," said one Aspen resident who had to cut her daily morning jog along Rio Grande Trail short. The resident, who recently recovered from a bad bout with bronchitis, said she stopped running after the air quality forced her into a fit of coughing like she hadn't experienced in days.

Two other residents in perfectly good health reported that they opted not go on a bike ride that morning because of the charcoal-colored conditions.

Although the skies changed from gray back to blue as the day wore on, weather watchers warn that there could be more smoke to come.

"The trough will move very slowly eastward over the next several days, so this area will remain under a west-to-southwest wind flow for a while. Many of the California fires are expected to burn for some time, so hazy conditions can be expected here throughout the weekend and into next week," said the Grand Junction-based National Weather Service report.

## The worst is over at Snowmass Creek fire

By Adam Preskill/Aspen Daily News Staff Writer

The Snowmass Creek fire was 50 percent contained at sundown Friday, with firefighters hoping that impending precipitation would help smother the blaze for good.

Investigators have confirmed that fallen power lines triggered the fire, which began sometime before noon Thursday on a remote portion of a ranch owned by Disney Co. CEO Michael Eisner.

The fire continued to build throughout the day and overnight, ultimately chewing up 51 acres of wooded hillside along Snowmass Creek Road. But by midday Friday the blaze had been cut down considerably through the efforts of the 80 fire personnel on the scene, and as night fell little was left beyond a few smoldering patches beneath a ridgeline on Eagle Mountain.

"The fire's really not spreading significantly – it's kind of just laid down," said Joe Disalvo, public information officer for the Pitkin County Sheriff's Office.

Federal fire crews reached the scene early in the day and took over command of the fire, which is now primarily limited to federal property under the jurisdiction of the Bureau of Land Management.

"They have better resources to handle a situation like this than we do locally," Disalvo said.

Firefighters from around the Roaring Fork Valley were called to the scene yesterday, including personnel from Snowmass Village, Aspen, Carbondale and Basalt fire districts.

Fire crews spent the day fighting the wildfire on foot, digging trenches and using hoses to cut off fuel sources for the blaze, Disalvo said. With rain and snow in the weather forecast for today, there's a chance that the toughest part of the job is over, he noted.

"Tonight we're going to take them out of the field, rest them up, and see what the situation needs for tomorrow. If it's snowing or raining, we'll be able to reduce our numbers," Disalvo said.

Although helicopters were available to provide air support both Thursday and Friday, heavy winds prevented any such measures from being used.

No major structures burned in the Snowmass Creek fire, although one small, uninhabited outbuilding was consumed. There was no danger to any structures in the area at nightfall, Disalvo.

While residents within a one-mile radius of the fire were encouraged by the sheriff's department

[http://www.aspendailynews.com/Search\\_Articles/view\\_search\\_article.cfm?OrderNumber...](http://www.aspendailynews.com/Search_Articles/view_search_article.cfm?OrderNumber...) 11/10/2003

to evacuate, homeowners have now been allowed to return, although the road remains closed to the public at both ends of the fire. Electrical power has also been restored to most of the homes in the area, Disalvo said, although some sporadic outages have occurred.

Haze from California fires move into valley

Scott Schwebke

MONTROSE - Smoke from devastating wildfires in California may cause hazy conditions for the next several days throughout the Uncompahgre Valley.

A strong, upper level trough centered over the Pacific Northwest has drifted south, causing strong southwesterly winds to push thick smoke from the Southern California fires into Colorado, said Jim Daniels, a meteorologist for the National Weather Service in Grand Junction.

The Uncompahgre Valley was buffeted by high winds Wednesday night, and early this morning the National Weather Service clocked wind speeds at 45-55 mph over west-central Colorado.

Haze from the California fires could be seen this morning from Avon to the Four Corners area and may continue through Saturday, Daniels said.

The fires have destroyed more than 2,600 homes and blackened more than 660,000 acres - about 1,030 square miles, or roughly the size of Rhode Island. Twenty people have been killed, including one firefighter.

Nine members of the Montrose Interagency Fire Management Unit have been sent to Southern California to provide dispatch assistance and other help, said Steve Ellis, the unit's fire management officer.

The Associated Press contributed to this report.

## Smoke from California raises health concerns

By Dale Rodebaugh  
Herald Staff Writer

Four Corners residents who imagined themselves in hazy Los Angeles on Thursday morning because of the smoky skies were partially right.

NANCY RICHMOND / Herald

**Smoke fills the La Plata Mountains as seen from Hesperus Hill on Thursday. Smoke from the fires burning in Southern California reached Southwest Colorado on Wednesday evening. On Thursday, the Colorado Department of Public Health and Environment's air-quality advisory for the Southwest Colorado warned the air could be unhealthy for the elderly, those with respiratory ailments or others with health problems.**

California forest-fire smoke is here, and it led the Colorado Department of Public Health to issue warnings in its air-quality advisory for Thursday for Southwest Colorado.

An air-quality expert from the San Juan Basin Health Department said the air was so poor Thursday it could be unhealthy especially for at-risk groups such as the elderly and those suffering from respiratory ailments.

The Durango Interagency Fire Dispatch Center said prevailing winds from the west are propelling smoke from nine wildfires in California and a wildland-use fire on the north rim of the Grand Canyon into the Four Corners.

**Michael  
Nargi  
Homes**

A wildland-use fire is a fire set and controlled by foresters to reduce accumulated ground fuel in the woods.

While smoke-streaked skies in the Four Corners are less than appealing, it could be worse, according to a La Plata County air-quality expert.

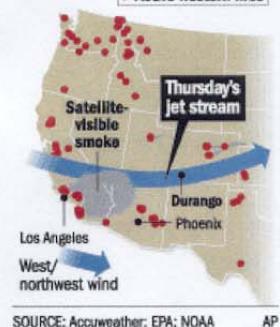

"Air quality is not nearly as poor as during the Missionary Ridge Fire two summers ago," said Nathan Ballenger, air-quality specialist with the San Juan Basin Health Department. "But at-risk people should stay indoors, keep windows and doors closed and do no heavy exercise."

Ballenger said the at-risk list includes the elderly, children 7 years old or younger and people with pre-existing respiratory problems such as asthma, emphysema, cardiovascular disease or infectious diseases such as colds or the flu.

### Wildfire smoke traveling east

Particles of smoke and ash from the California wildfires are at unhealthy levels in many areas including Los Angeles, San Bernardino and San Diego. The fires have given off an estimated 133,000 tons of these particles. Now, they are being transported along a broad jet stream.

• Active western fires

SOURCE: Accuweather, EPA; NOAA AP

"Even people considered healthy might experience symptoms," Ballenger said. "Symptoms could include eye, nose, mouth and throat irritation, coughing, trouble breathing or tightness of chest."

The Colorado Department of Public Health and Environment's Web site reported Thursday afternoon that air quality in Southwest Colorado could be moderate to unhealthy into Thursday evening.

Lynn Westberg, director of the San Juan Basin Health Department, said filters that capture particulates in the air are sent to Denver every few days for analysis. Westberg said there was no way to tell Thursday evening if air quality would be a problem today.

Although Thursday's air-quality was poor, Mercy Medical Center's emergency room didn't see anyone for smoke-related complaints on Thursday, said spokesman David Bruzzese.

"I don't know if people went to their primary-care physicians, but the emergency room didn't see anyone," he said.

According to the National Interagency Fire Center, 11 wildfires in California (nine of them in Southern California) had burned 730,000 acres and thousands of people remain evacuated. Nearly 13,000 firefighters and support personnel are battling the blazes.

So far this year, 55,914 wildfires have consumed 3.5 million acres across the country. Last year, 88,458 fires burned 6.9 million acres in the United States. The cost of fire suppression last year was \$1.6 billion.
